

Relative disturbance vs. spatial clustering of mortality

tc >= 30% (93 sites) | each point = one site (max relative disturbance across years vs mean Moran's I across years)

dashed lines = natural-break High threshold for each variable

- High disturbance + High clustering (11.8%, n=11)
- High clustering only (17.2%, n=16)
- High disturbance only (12.9%, n=12)
- Neither (58.1%, n=54)

NB disturbance = 34.5% | NB clustering = 0.810 | Fisher's exact test on the quadrant split: $p=0.033$, $OR=3.05$
