

Direction of the disturbance effect ... by relative mortality

Tree cover ...30 % (93 sites) · M4 · natural-breaks split on relative mortality · below zero = the model predicts a LOWER value of the EFP (not worse accuracy)
stars = Mann-Whitney U between Low+Mid and High (unequal n), BH-FDR across the figure (***) $q < 0.001$, ** $q < 0.01$, * $q < 0.05$)

Net signed disturbance SHAP
(effect on the PREDICTED value, response units)

Low+Mid High
