

Does forest stand age predict the direction of the disturbance effect?

Forest age (Besnard et al. 2021, ForestAge_TC030, 1500m buffer mean) vs net signed disturbance SHAP

tree cover >= 30% (91/93 sites with age data) | XGBoost-Optuna, M4 | linear fit with 95% CI | Spearman rho, BH-FDR across all 8 tests

Below zero = model predicts a LOWER EFP value where mortality is present (not worse accuracy, see Fig 4). Age not adjusted for measurement year.
